

Basic Linux Commands

for DevOps:

Linux File & Directories

1. ls - List directory contents.
2. cd - Change the current directory.
3. mkdir - Create new directories.
4. rm - Remove files or directories.
5. cp - Copy files or directories.
6. mv - Move or rename files or directories.
7. find - Search for files in a directory hierarchy.
8. touch - Change file timestamps or create an empty file.
9. ln - Create hard and symbolic links.
10. df - Report file system disk space usage.
11. du - Estimate file space usage.
12. tree - Display directory structure in a tree-like format.

Linux Editors

1. nano - Simple, user-friendly text editor.
2. vi/vim - Powerful text editor with advanced features.
3. cat - Concatenate and display file content.
4. more - View file content page by page.
5. less - View file content page by page (more advanced than more).
6. head - Output the first part of files.
7. tail - Output the last part of files.
8. sed - Stream editor for filtering and transforming text.
9. awk - Pattern scanning and processing language.

Process Management

1. ps - Report a snapshot of current processes.
2. top - Display and manage system processes in real-time.
3. htop - Interactive process viewer.
4. kill - Terminate processes by ID.
5. pkill - Kill processes by name.
6. killall - Kill processes by name.
7. bg - Resume a suspended job in the background.
8. fg - Bring a background job to the foreground.

Permissions & Ownership

1. chmod - Change file modes or access permissions.

2. `chown` - Change file owner and group.
3. `chgrp` - Change group ownership.
4. `umask` - Set default file permissions.

Disk Usage

1. `df` - Report file system disk space usage.
2. `du` - Estimate file space usage.
3. `fdisk` - Partition table manipulator for Linux.
4. `mount` - Mount a file system.
5. `umount` - Unmount file systems.

System Monitoring

1. `dmesg` - Print or control the kernel ring buffer.
2. `vmstat` - Report virtual memory statistics.
3. `iostat` - Report CPU and I/O statistics.
4. `free` - Display amount of free and used memory in the system.

Package Management

1. `apt-get` - APT package handling utility (Debian-based systems).
2. `yum` - Package manager for RPM-based distributions.
3. `dnf` - Fedora package manager.
4. `rpm` - RPM package manager.
5. `dpkg` - Debian package manager.

System Information

1. `uname` - Print system information.
2. `hostname` - Show or set the system's host name.
3. `lsb_release` - Print distribution-specific information.
4. `lscpu` - Display information about the CPU architecture.
5. `lsblk` - List information about block devices.

Searching and Filtering

1. `grep` - Print lines that match patterns.
2. `egrep` - Extended grep.
3. `fgrep` - Fixed-string grep.

4. locate - Find files by name.
5. which - Locate a command.
6. whereis - Locate the binary, source, and manual page files for a command.

Linux Networking

1. ifconfig - Display or configure network interfaces.
2. ping - Check connectivity to a server.
3. netstat - Network statistics and active connections.
4. scp - Securely copy files between hosts.
5. curl - Transfer data from or to a server.
6. wget - Retrieve files from the web.
7. nslookup - Query Internet name servers interactively.
8. traceroute - Print the route packets take to the network host.
9. ssh - OpenSSH SSH client (remote login program).
10. iptables - Administration tool for IPv4 packet filtering and NAT.
